

Microsoft Fabric: Pediatric Encounter Demo

Synthetic pediatric encounter data. Built to demonstrate ingestion, transformation, semantic modeling, validation, and Power BI reporting.

1. Bronze Layer

- Workspace: CHOA ANALYTICS DEMO
- Lakehouse: Pediatric_Data_Lake
- Raw table: pediatric_encounters_bronze
- Loaded source encounter file into Lakehouse
- Purpose: preserve source structure**

2. Transformation Layer

- Applied Dataflow Gen2 transformations
- Created derived reporting fields
- Prepared data for validation and modeling
- Purpose: shape raw data into analytics-ready structure**

3. Validation

- Verified total encounter counts
- Checked department level counts
- Confirmed data types and reviewed derived reporting fields
- Purpose: validate source-to-report accuracy**

4. Gold Layer

- Curated Delta Table
- Table: pediatric_encounters_gold
- Combined source fields with derived fields
- Ready for measures, visuals, and reporting
- Purpose: clean, validated table for semantic model**

5. Power BI Output

- Built one-page Power BI report
- Created KPI cards and visual summaries
- Used DAX measures from semantic model
- Purpose: communicate validated encounter metrics in executive-ready report**
